

A. Transfer designs

Direction A: PBMC10k $\rightarrow$ PBMC5k
Direction B: PBMC5k $\rightarrow$ PBMC10k

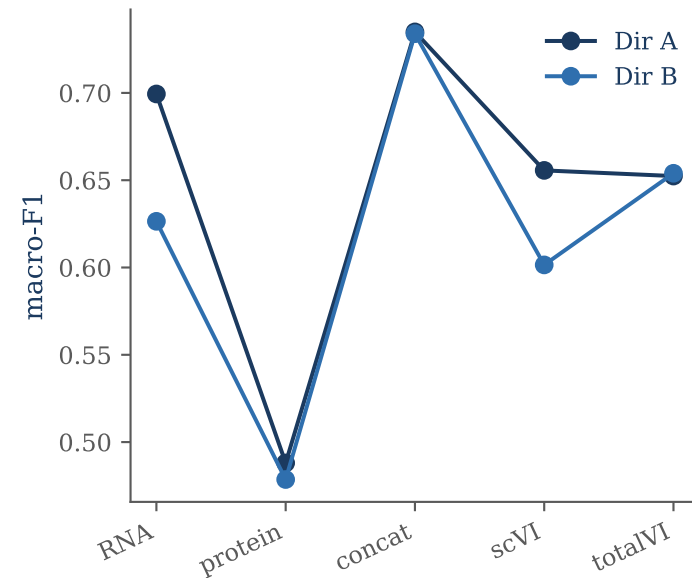

Deep models: unsupervised
transductive scArches adaptation

Concat PCA: inductive
source-fitted transform only

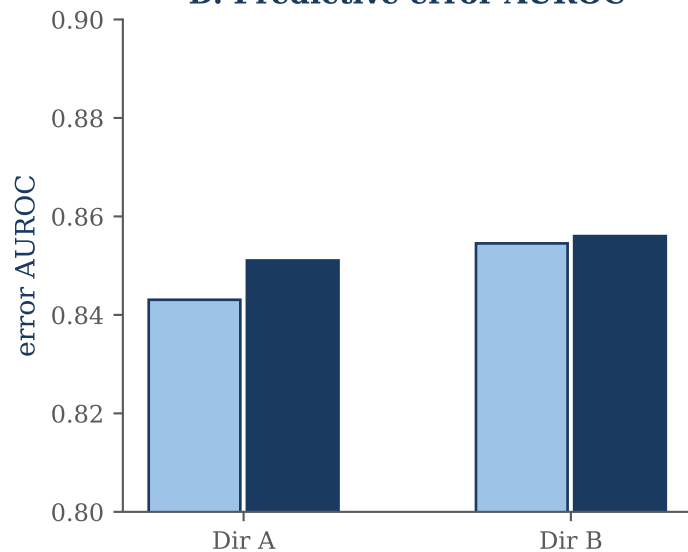

B. 20-seed transfer (mean $\pm$ SD)

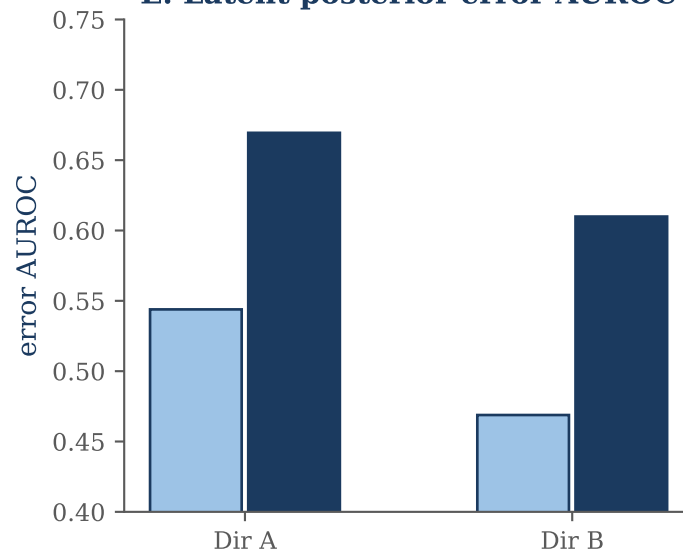

C. Inductive concat vs adapted VAEs

D. Predictive error AUROC

E. Latent posterior error AUROC

F. Uncertainty definitions

Classifier predictive uncertainty:
 $U_{\text{pred}} = 1 - \max_k p(y=k | z)$

Latent posterior variance:
 $U_{\text{latent}} = (1/d) \sum_j \text{Var}[z_j | x]$
 $d = 20$

These are distinct quantities;
do not equate latent variance with
epistemic uncertainty.
